No More Having to Leave Out Section of Stone Cladding !!!

Complete the Building Exterior in one Go

**Re Use Tying Positions Year after Year for
Building Maintenance.**

Think of The Savings to Your Company

ASK KDK FOR DETAILS

KDK are appointed sole agents for Koro ties in Ireland and Great Britain.

The sleeve is inserted into a bed of mortar in the wall to protrude to the inside edge of cladding in line with horizontal or vertical joint dependent of type used. The Ring Plate protrudes through the cladding joint and is connected to the scaffolding by an adjustable anchor bar. The position of the sleeve is recorded on an elevation to be included into the safety file for future maintenance and repairs to the building.

On striking the scaffold the anchor bar is removed, then also the ring plate. A coloured plastic cap is inserted into the ring plate hole or the remainder of the joint is closed with compound. When future maintenance of the building is required, locate plastic cap, remove same, insert ring plate and connect to scaffold.
